

Dear Dr. *****,

** ** ***** *****; ** ** *****; **/**/****; ** ***** ****, *****, Southampton, **** 7Z

I had the pleasure of seeing Ms ***** ***** in clinic today. She a Grade III endometrial ad and began curative chemotherapy on the ***** **, ****. She has responded well to treatment to summarise her response so far.

Initial Staging & Diagnosis

Ms. ***** was initially diagnosed in ***** with FIGO stage III endometrial adenocarcinoma. diagnosis was confirmed via biopsy, and subsequent staging was determined based on imaging and histopathological evaluation.

Histological analysis confirmed a high-grade endometrioid adenocarcinoma. Genetic testing revealed microsatellite instability (MSI-High) and the presence of a **** mutation, which is often associated with a favourable prognosis and higher sensitivity to chemotherapy. **** status was tested and found to be negative.

Chemotherapy Regimen

On **/**/****, Ms. ***** was commenced on a chemotherapy regimen consisting of Carboplatin (AUC 2) and Paclitaxel (175 mg/m²) administered every three weeks. She has completed six cycles of this regimen without significant complications.

Response to Chemotherapy

Ms. ***** has shown a positive response to the chemotherapy regimen, as evidenced by the significant reduction in tumour burden noted on imaging studies. Her **-*** levels, which were elevated at the start of treatment, have now normalized. Clinically, she has reported an improvement in symptoms. Recent CT imaging of the chest, abdomen, and pelvis has shown a marked reduction in the size of the previously noted pelvic and para-aortic lymphadenopathy. There is no evidence of new lesions or metastatic spread, and the primary uterine mass has significantly decreased in size. We will continue to monitor Ms. ***** with regular follow-up visits, including physical examination, blood tests, and periodic imaging studies to assess for disease recurrence. She is scheduled for her next review.

Yours *****,

** ***** *****
