Dear [PROVIDER-NAME] [NAME] , [ADDRESS]. [POSTCODE]

DOB: [DATE] , Hospital Number: [MED-ID] , NHS Number: [NHS-NO]

Diagnosis: Crohn's disease 2004.

Medication: Humira 40mgs every other week (April 2014).

Previous Medication : Azathioprine, ? over immunosuppression.

I reviewed Jason in clinic today. At the last consultation we discussed holding off the Azathioprine as it transpired his TGN levels are over double the therapeutic range and this may well have been the cause of some adverse symptoms that he is experiencing. He was complaining of night sweats. Since starting on Azathioprine he has not experienced any of these. He still has a persistent verruca however it has not been taken sometime to clear all of the Azathioprine from his system so he is now going to concentrate on trying to treat this verruca.

I believe he had some routine bloods taken at Salisbury Hospital and I will chase these results from our records. I have reassured him that he can have his bloods taken locally every three months. I have handed in a faecal calprotectin and I have informed him it does take a couple of weeks to process. The sample is currently in progress. I will inform him should the results be abnormal in anyway. I will give him a further supply of pots and forms so that we can check this at three to six months. Otherwise he will continue on the Humira monotherapy. Again as we discussed previously if he has an elevated calprotectin we would definitely go ahead with a colonoscopy. However as things are settled other than a degree of bloating but only when he is lying on his back he does not have any obstructive symptoms and he is aware that if he does experience any changes with stool he will come back with regards to having a colonoscopy +/- dilatation.

We have him signed up to my medical records. We will see him back in clinic in a year's time.

With kind regards

Yours sincerely
